

EXECUTIVE CASE STUDY: ENTERPRISE WORKFORCE & PERFORMANCE CALIBRATION ANALYTICS

Author: Jesús Ángel Galicia Hernández | Senior HR Data & People Analytics Specialist

Domain: Enterprise HRIS Transformation & Performance Calibration

Architecture: Dual-Tier Analytics Framework (Excel Operations + Power BI Performance)

1. Executive Summary & Business Problem

In enterprise workforce management, traditional HR metrics often rely on fragmented spreadsheets that fail to isolate operational inefficiency from performance bias. Analysis of the global HRIS workforce dataset (3,000 Headcount) revealed a severe **Centrality Evaluation Bias**, where **78.7% of all performance evaluations were concentrated under the "Fully Meets" rating**, yielding an uncalibrated mean score of **2.97 / 5.0**.

This evaluation compression creates critical business risks:

- **Talent Attrition:** Obscures real High Performers, triggering turnover risk among key talent (**321 voluntary terminations** logged).
- **Compensation Misalignment:** Distorts merit-pay budget distribution across salary bands (PayZone).
- **Operational Inefficiency:** Manual monthly reporting consumed excessive analyst hours due to unstandardized data pipelines.

2. Analytical Solution Architecture (Dual-Tier Framework)

To bridge operational tracking with executive decision-making, an end-to-end analytical solution was engineered across two synchronized tiers:

- **Tier 1: Operational & Demographics Cockpit (Excel Layer)**
 - **Function:** Tactical monitoring of headcount velocity, active status, and geographic distribution.
 - **Key Metrics:** Total Headcount: **3,000** | Active Workforce: **2,458** | Voluntary Turnover: **321** | Avg. Tenure: **5.54 Years**.
 - **Deliverable:** Dynamic Excel Cockpit utilizing dynamic tables and Power Query data ingestion.

- **Tier 2: Performance Calibration & Rating Bias Analytics (Power BI Layer)**
 - **Function:** Strategic diagnostic tool engineered using Star Schema modeling and custom DAX measures.
 - **Key Metrics:** Rating Centrality Rate: **78.7%** | Mean Performance Rating: **2.97** | Departmental Rating Parity Range: **2.79 – 3.02**.
 - **Deliverable:** Executive Power BI Cockpit with interactive filtering across business units, PayZones, and performance tiers.

3. Governance & Risk Management Frameworks

To ensure long-term sustainability and data governance across global teams, two structural frameworks were established:

A. Enterprise RACI Governance Matrix

- **CHRO / HR VP:** Accountable (A) for merit pool allocation and final calibration approval.
- **HR Business Partners (HRBPs):** Responsible (R) for weekly joiner/leaver tracking and facilitating department calibration sessions.
- **Line Managers:** Consulted (C) regarding direct team evaluations and performance inputs.
- **People Analytics / HRIS:** Responsible/Accountable (R/A) for M-Code ETL pipelines, DAX measure governance, and Row-Level Security (RLS).

B. RAID Risk Mitigation Log

- **Risk (Talent Flight):** High-performer attrition due to uncalibrated evaluations → *Mitigation:* Mandate talent calibration committees and performance curve distribution.
- **Assumption (Data Integrity):** HRIS data exports (Workday/SAP) are consistent → *Mitigation:* Automated data cleansing and type-validation rules implemented via Power Query.
- **Issue (Manual Inefficiency):** Disconnected operational spreadsheets → *Mitigation:* Implemented Power BI Star Schema with automated scheduled refresh.

- **Dependency (User Adoption):** Dashboard effectiveness relies on HRBP engagement → *Mitigation:* Technical enablement workshops and strict HRIS SLA entry policies.

4. Quantifiable Business Impact

- **~95% Reduction in ETL Cycle Time:** Automated M-code ingestion pipelines eliminated manual spreadsheet manipulation.
- **Data-Driven Calibration:** Provided HR leadership with concrete empirical evidence to enforce manager rating distribution.
- **Executive Design Standards:** Applied corporate UI/UX guidelines (McKinsey/Deloitte executive palettes) to maximize executive adoption.
